# Alexander Pritchard | Portfolio Goals

My intention with my portfolio is to make something simple that showcases the work I have clearly, placing more focus on the featured work than other “visual noise” or too many bells and whistles throughout the website. That said, I do want it to have a nice, clean appearance. I intend to use a lot of white, black and dark blue. I believe the colors will work well together, and blue is a favorite color of mine, so I intend to make it part of my identity on this website / showcase.

## Visual Inspiration

My intended look for the website is a boxy, modern appearance. My biggest inspiration or reference for the visual style of the website would be something similar to the visual presentation and motion graphics of the “Playstation State Of Play” presentations, which feature a collection of basic shapes and blue squares shifting and moving around to uncover the information or text on the screen. It has a very sleek, modern appearance with a lot of blue and white, and lots of hard edges.

I intend for the website to be a single page, with a few effects that trigger as it is scrolled down. I feel that separate pages would clutter the focus on just displaying my work and stating my skills or areas of interest.

I have not yet picked a font style to use for my site, but I would like to use something bold and round, yet still professional looking.

## Area of Interest

My areas of interest that I plan to advertise on the website and obtain a career in would definitely be UI/UX designs, things like motion graphics, or even wireframe building. I enjoy the design end of things in this program, and I already have plenty more experience using programs like Adobe Premiere, Photoshop, and Illustrator. This makes me feel more comfortable focusing on showing my work and skills in that field for this portfolio site.

## Animations / Interactivity

As I described above, my planned animations for scrolling the site will mainly include the movement of blue squares and other shapes shifting around the screen, layered behind the text and other content on the site. I would also like to add simple hover

effects for most content, as I feel it would benefit the user experience overall, offering visual feedback for every little thing helps it maintain a bouncy vibe and encourages the user to keep interacting with elements of the site.

## Five Goals:

**1**: Create a website that effectively showcases my work in a clean, easy to access fashion. This will act as a reference point that I can build off of at any time and update with new or current work as I see fit so that my own identity is always visible and always within my control.

**2**: Allow my own personal identity to shine through in the way I present the website. By using my accumulated skills in this program, I can make a website that looks the way I want it, with visuals and animations/interactivity that helps showcase my abilities while being wholly unique to myself.

**3**: Make the website appear professional and enticing to potential employers. This will maximize my chances of my portfolio being viewed fully and seen as respectable by anyone who views the website, whether they're an employer or not.

**4**: Showcase my work and aptitude in UI design, Motion Graphics, or even 3D software and animation. This is necessary as these things are my primary focus and the fields I wish to enter into when I step into a career.

**5**: Use the process of making this portfolio site as a learning process towards not only presenting myself both professionally and personally, but making use of all that I've learned throughout the program and taking note of it so that I may chip away at my website and work on it beyond my time in this program.
